Durakryl 102 (an ultra violet cured coating) is a proprietary formulation which when cured leaves an inert film. The constituents of the cured film have been tested by an independent university laboratory and found to be non-toxic.

Since the film is approximately 95% cured in the manufacturing process with 100% cure within 2 weeks of manufacture only inert film is present on installed tops used as manufactured.

Since butcher block is such a versatile product our tops are used for many applications. We have had our Durakryl 102 tested to see how it reacts to many household and industrial products. The following is a listing of products tested and the results of the testing. The results are listed as passed (no effect), failed (moderate to severe effect) a moderate effect would be a softening of the finish, or a discoloration of the finish.
